Received and published: 14 December 2016

In our recent responses to reviewer II's comments, we mentioned that the current study provides a baseline for further examining the role of the extended nonlinear feedback loop in producing quasi-periodic solutions in a 5D non-dissipative Lorenz model. Here, we would like to share some of preliminary results which were presented by Ms. Faghih-Naini on December 8. The presentation slides are uploaded as supplemental materials. Based on the results, a manuscript is in preparation and will be submitted for publication soon.
