We are very thankful for the reviewer’s suggestion to justify the assumptions of the Markov model approach in terms of its applicability for stable boundary layer regime dynamics in more detail. In the introduction of the new manuscript we justify our choice of testing the Markov model assumption as a foundation for SBL regime dynamics (cf. p.4 ll. 1-11). However, as it turns out the Markov model does not suffice to model SBL regime dynamics (p.10 ll. 1-5) we do not overrate its potential and do not try to speculate which particular physical properties might or might not be approximated by a Markov assumption. Instead, we lead the discussion to the finding that additional com-

C1

plexity in a possible stochastic parameterisation is needed (state dependent transition probabilities; section 5.1) and how we can develop a realistic yet simple stochastic parameterisation (cf. section 5.2). Justification for particular choices of building the stochastic parameterisation representing typical physical SBL phenomena are stated in those sections.

The revised manuscript is attached.
