Received and published: 24 June 2019

In Introduction (L. 19-21), the authors stated that Canitano et al. (2015) observed changes in the crustal deformation prior to the October 2013 Ruisui earthquake, Taiwan. There is a possible confusion here, Canitano et al. (2015) analyzed the strain signals 10 s before the rupture but found no evidence for preseismic strain changes (at least at the instrumental noise level ~ 0.01 - 0.1 s nstrain).
